

World Record SPEC CPU2006 Benchmark Result for 1-Processor ThinkSystem SR650

Performance Benchmark Result (withdrawn product)

November 8, 2017... Lenovo has published a top SPEC CPU2006 benchmark score for the Lenovo ThinkSystem SR650 rack server, using one Intel Xeon Platinum 8180 processor with 28 cores.

The SPECint_rate_base2006 score is ideal for measuring multi-threaded compute-intensive applications, such as High Performance Computing (HPC) workloads.

The ThinkSystem SR650 achieved the following SPECint score:

- **SPECint_rate_base2006: 1300**

The ThinkSystem SR650 was configured as follows:

- One Intel Xeon Platinum 8180 processor (2.5 GHz, 38.5 MB L3 cache, 28 cores)
- 192 GB of TruDDR4 memory
- SUSE Linux Enterprise Server® 12 SP2

Results referenced are current as of November 8, 2017.

About the ThinkSystem SR650

For medium to large enterprises, and managed and cloud service providers, Lenovo ThinkSystem SR650 is the optimum 2U, two-socket server—the most widely used server type worldwide. It's engineered to deliver high performance with 205W CPUs, low-latency NVMe drives, and high-power GPUs.

With Lenovo's history of reliability, the highly flexible and configurable SR650 is the ideal platform for hyper-converged infrastructure (HCI) or software-defined storage (SDS). It provides a solid foundation for:

- Transforming physical resources into services, using validated designs for hybrid cloud
- Performing analytics on streaming data, using validated designs for Big Data
- Increasing productivity of virtualized transactional systems, using validated designs for OLTP databases.

Lenovo XClarity Controller is an all-new hardware embedded management engine common in every ThinkSystem server. XClarity Controller features an uncluttered graphical user interface, industry standard Redfish-compliant REST APIs, and enables booting in half the time of prior generation servers, with up to 6x faster firmware updates.

Lenovo XClarity Administrator is a virtualized application that centrally manages ThinkSystem servers, storage, and networking. Via reusable patterns and policies, it ramps up and scales infrastructure provisioning and maintenance. It serves as a central integration point to extend your data center management processes to physical IT. Running XClarity Integrators in external IT applications, or integrating through REST APIs, helps you further speed services provisioning, streamline IT management, and contain costs.

About SPEC CPU2006

The SPEC CPU 2006 benchmark is SPEC's industry-standardized, CPU-intensive benchmark suite, stressing a system's processor, memory subsystem and compiler. CPU2006 is a set of benchmarks designed to test the CPU and memory performance of a modern server.

The SPEC CPU 2006 benchmark has several different ways to measure server performance:

- Speed measurement: Measure how fast the server completes a single task
- Throughput, capacity or rate measurement: Measure how many tasks a server can accomplish in a certain amount of time.

This benchmark is targeted for use by hardware vendors, IT industry, computer manufacturers, and government.
