

ThinkSystem CD9P Read Intensive NVMe PCIe 5.0 SSDs

Product Guide

The ThinkSystem CD9P Read Intensive NVMe PCIe 5.0 SSDs, available in capacities up to 61.44TB, are general-purpose yet high-performance NVMe PCIe Gen 5 SSDs. They are engineered for greater performance and endurance in a cost-effective design, and to support a broader set of workloads. Now with SED encryption as standard, these drives help ensure data security, even when the drive is removed from the server.

SED support: All drives listed in this product guide include SED drive encryption. Our naming convention for new drives doesn't include SED in the name.

Figure 1. ThinkSystem CD9P Read Intensive NVMe PCIe 5.0 SSDs

Did you know?

The CD9P SSDs are part of the new family of PCIe 5.0 SSDs that match the performance of the ThinkSystem V3 and V4 family of servers. By having a Gen 5 host interface, sequential performance is doubled compared to Gen 4 SSDs. The NVMe host interface also maximizes flash storage performance and minimizes latency.

Lenovo Read Intensive SSDs like the CD9P SSDs are suitable for read-intensive and general-purpose data center workloads, however their NVMe PCIe interface means the drives also offer high performance. Overall, these SSDs provide outstanding IOPS/watt and cost/IOPS for enterprise solutions.

Part number information

The following table lists the part numbers and feature codes for ThinkSystem servers.

Table 1. Ordering information

Part number	Feature	Description	Vendor part number
2.5-inch hot-swap drives			
4XB7B14455	CGP9	ThinkSystem 2.5" U.2 CD9P 1.92TB Read Intensive NVMe PCIe 5.0 x4 HS SSD	KCD9DPUG1T92
4XB7B14456	CGP8	ThinkSystem 2.5" U.2 CD9P 3.84TB Read Intensive NVMe PCIe 5.0 x4 HS SSD	KCD9DPUG3T84
4XB7B14457	CGP7	ThinkSystem 2.5" U.2 CD9P 7.68TB Read Intensive NVMe PCIe 5.0 x4 HS SSD	KCD9DPUG7T68
4XB7B14458	CGP6	ThinkSystem 2.5" U.2 CD9P 15.36TB Read Intensive NVMe PCIe 5.0 x4 HS SSD	KCD9DPUG15T3
4XB7B14459	CGPA	ThinkSystem 2.5" U.2 CD9P 30.72TB Read Intensive NVMe PCIe 5.0 x4 HS SSD	KCD9DPUG30T7
4XB7B14460	CGP5	ThinkSystem 2.5" U.2 CD9P 61.44TB Read Intensive NVMe PCIe 5.0 x4 HS SSD	KCD9DPUG61T4

The part numbers include the following items:

- One solid-state drive
- Attached hot-swap tray (for hot-swap drives)
- Documentation flyer

Features

Non-Volatile Memory Express (NVMe) is PCIe high performance SSD technology that provides high I/O throughput and low latency. NVMe interfaces remove SAS/SATA bottlenecks and unleash all of the capabilities of contemporary NAND flash memory. Each of the CD9P SSDs have direct PCIe 5.0 x4 connection, which provides at significantly greater bandwidth and lower latency than SATA/SAS-based SSD solutions. NVMe drives are also optimized for heavy multi-threaded workloads by using internal parallelism and many other improvements, such as enlarged I/O queues.

The ThinkSystem CD9P Read Intensive NVMe PCIe 5.0 SSDs have the following features:

- Based on the Kioxia CD9P-R drives
- Available as 15mm 2.5-inch drives in a hot-swap tray
- Direct PCIe 5.0 x4 connection for each NVMe drive, resulting in up to 14 GBps overall throughput, compared to 7.5 GBps for a PCIe 4.0 connection.
- Also supports PCIe 4.0 and 3.0 host connection for previous-generation servers
- Based on KIOXIA BiCS FLASH Gen 5 TLC flash memory
- Single-port design, optimized for data center class workloads
- Consistent performance and reliability for demanding 24x7 environments
- Designed for high-density storage deployments
- Power loss protection (PLP) and end-to-end data correction

- Supports Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T).
- SED support for TCG Opal SSC V2.02
- Supports the following specifications:
 - PCI Express Base Specification, Revision 5.0
 - NVM Express Specification, Revision 2.0
 - NVM Express Management Interface, Revision 1.2c

Read Intensive SSDs and Write Intensive SSDs have similar read IOPS performance, but the key difference between them is their endurance -- how long they can reliably perform write operations. Read Intensive SSDs have a better cost/IOPS ratio but lower endurance compared to Write Intensive SSDs. SSD write endurance is typically measured by the number of program/erase (P/E) write cycles that the drive incurs over its lifetime, listed as the total bytes of written data (TBW) in the device specification.

The TBW value assigned to a solid-state device is the total bytes of written data (based on the number of P/E cycles) that a drive can be guaranteed to complete (% of remaining P/E cycles = % of remaining TBW). Reaching this limit does not cause the drive to immediately fail. It simply denotes the maximum number of writes that can be guaranteed. A solid-state device will not fail upon reaching the specified TBW. At some point based on manufacturing variance margin, after surpassing the TBW value, the drive will reach the end-of-life point, at which the drive will go into a read-only mode.

Because of such behavior by Read Intensive solid-state drives, careful planning must be done to use them only in read-intensive or mixed up to 70% read/30% write environments to ensure that the TBW of the drive will not be exceeded before the required life expectancy.

For example, the 3.84 TB GB CD9P Read Intensive drive has an endurance of 7,008 TB of total bytes written (TBW). This means that for full operation over five years, write workload must be limited to no more than 3,840 GB of writes per day, which is equivalent to 1.0 full drive writes per day (DWPD). For the device to last three years, the drive write workload must be limited to no more than 6,400 GB of writes per day, which is equivalent to 1.7 full drive writes per day.

The benefits of drive encryption

All ThinkSystem CD9P Read Intensive NVMe PCIe 5.0 SSDs support drive encryption.

Self-encrypting drives (SEDs) provide benefits in three main ways:

- By encrypting data on-the-fly at the drive level with no performance impact
- By providing instant secure erasure (cryptographic erasure, thereby making the data no longer readable)
- By enabling auto-locking to secure active data if a drive is misplaced or stolen from a system while in use

The following sections describe the benefits in more details.

Automatic encryption

It is vital that a company keep its data secure. With the threat of data loss due to physical theft or improper inventory practices, it is important that the data be encrypted. However, challenges with performance, scalability, and complexity have led IT departments to push back against security policies that require the use of encryption. In addition, encryption has been viewed as risky by those unfamiliar with key management, a process for ensuring a company can always decrypt its own data. Self-encrypting drives comprehensively resolve these issues, making encryption both easy and affordable.

When the self-encrypting drive is in normal use, its owner need not maintain authentication keys (otherwise known as credentials or passwords) in order to access the data on the drive. The self-encrypting drive will encrypt data being written to the drive and decrypt data being read from it, all without requiring an authentication key from the owner.

Drive retirement and disposal

When hard drives are retired and moved outside the physically protected data center into the hands of others, the data on those drives is put at significant risk. IT departments retire drives for a variety of reasons, including:

- Returning drives for warranty, repair, or expired lease agreements
- Removal and disposal of drives
- Repurposing drives for other storage duties

Nearly all drives eventually leave the data center and their owner's control. Corporate data resides on such drives, and when most leave the data center, the data they contain is still readable. Even data that has been striped across many drives in a RAID array is vulnerable to data theft because just a typical single stripe in today's high-capacity arrays is large enough to expose for example, hundreds of names and bank account numbers.

In an effort to avoid data breaches and the ensuing customer notifications required by data privacy laws, companies use different methods to erase the data on retired drives before they leave the premises and potentially fall into the wrong hands. Current retirement practices that are designed to make data unreadable rely on significant human involvement in the process, and are thus subject to both technical and human failure.

The drawbacks of today's drive retirement practices include the following:

- Overwriting drive data is expensive, tying up valuable system resources for days. No notification of completion is generated by the drive, and overwriting won't cover reallocated sectors, leaving that data exposed.
- Methods that include degaussing or physically shredding a drive are expensive. It is difficult to ensure the degauss strength is optimized for the drive type, potentially leaving readable data on the drive. Physically shredding the drive is environmentally hazardous, and neither practice allows the drive to be returned for warranty or expired lease.
- Some companies have concluded the only way to securely retire drives is to keep them in their control, storing them indefinitely in warehouses. But this is not truly secure because a large volume of drives coupled with human involvement inevitably leads to some drives being lost or stolen.
- Professional disposal services is an expensive option and includes the cost of reconciling the services as well as internal reports and auditing. Transporting of the drives also has the potential of putting the data at risk.

Self-encrypting drives eliminate the need to overwrite, destroy, or store retired drives. When the drive is to be retired, it can be cryptographically erased, a process that is nearly instantaneous regardless of the capacity of the drive.

Instant secure erase

The self-encrypting drive provides instant data encryption key destruction via cryptographic erasure. When it is time to retire or repurpose the drive, the owner sends a command to the drive to perform a cryptographic erasure. Cryptographic erasure simply replaces the encryption key inside the encrypted drive, making it impossible to ever decrypt the data encrypted with the deleted key.

Self-encrypting drives reduce IT operating expenses by reducing asset control challenges and disposal costs. Data security with self-encrypting drives helps ensure compliance with privacy regulations without hindering IT efficiency. So called "Safe Harbor" clauses in government regulations allow companies to not have to notify customers of occurrences of data theft if that data was encrypted and therefore unreadable.

Furthermore, self-encrypting drives simplify decommissioning and preserve hardware value for returns and repurposing by:

- Eliminating the need to overwrite or destroy the drive
- Securing warranty returns and expired lease returns
- Enabling drives to be repurposed securely

Auto-locking

Insider theft or misplacement is a growing concern for businesses of all sizes; in addition, managers of branch offices and small businesses without strong physical security face greater vulnerability to external theft. Self-encrypting drives include a feature called auto-lock mode to help secure active data against theft.

Using a self-encrypting drive when auto-lock mode is enabled simply requires securing the drive with an authentication key. When secured in this manner, the drive's data encryption key is locked whenever the drive is powered down. In other words, the moment the self-encrypting drive is switched off or unplugged, it automatically locks down the drive's data.

When the self-encrypting drive is then powered back on, it requires authentication before being able to unlock its encryption key and read any data on the drive, thus protecting against misplacement and theft.

While using self-encrypting drives just for the instant secure erase is an extremely efficient and effective means to help securely retire a drive, using self-encrypting drives in auto-lock mode provides even more advantages. From the moment the drive or system is removed from the data center (with or without

authorization), the drive is locked. No advance thought or action is required from the data center administrator to protect the data. This helps prevent a breach should the drive be mishandled and helps secure the data against the threat of insider or outside theft.

Technical specifications

The following tables present the technical specifications for the CD9P SSDs. Note that the performance data and power consumption is based on a PCIe 5.0 host interface.

Table 2. Technical specifications

Feature	1.92 TB drive	3.84 TB drive	7.68 TB drive	15.36 TB drive	30.72 TB drive	61.44 TB drive
Interface	PCIe 5.0 x4	PCIe 5.0 x4	PCIe 5.0 x4	PCIe 5.0 x4	PCIe 5.0 x4	PCIe 5.0 x4
Form factors	2.5-inch	2.5-inch	2.5-inch	2.5-inch	2.5-inch	2.5-inch
Capacity	1.92 TB	3.84 TB	7.68 TB	15.36 TB	30.72 TB	61.44 TB
SED encryption	TCG Opal 2.02	TCG Opal 2.02	TCG Opal 2.02	TCG Opal 2.02	TCG Opal 2.02	TCG Opal 2.02
Endurance (drive writes per day for 5 years)	1 DWPD	1 DWPD	1 DWPD	1 DWPD	1 DWPD	1 DWPD
Endurance (total bytes written)	3504 TB	7008 TB	14,016 TB	28,032 TB	56,064 TB	112,128 TB
Data reliability (UBER)	< 1 in 10 ¹⁷ bits read	< 1 in 10 ¹⁷ bits read	< 1 in 10 ¹⁷ bits read	< 1 in 10 ¹⁷ bits read	< 1 in 10 ¹⁷ bits read	< 1 in 10 ¹⁷ bits read

Storage controller support

NVMe PCIe SSDs require a NVMe drive backplane and some form of PCIe connection to processors. PCIe connections can take the form of either an adapter (PCIe Interposer or PCIe extender/switch adapter) or simply a cable that connects to an onboard NVMe connector.

PCIe 4.0 & 3.0 support: The CD9P SSDs offer a PCIe 5.0 host interface, however they are backward compatible with a PCIe 4.0 or PCIe 3.0 host interface. Note however that servers or NVMe retimer/switch adapters with a PCIe 4.0 or 3.0 host interface will not see the same performance levels (especially sequential read and write rates).

Consult the relevant server product guide for details about required components for NVMe drive support.

Operating system support

The following tables list the supported operating systems.

Tip: These tables are automatically generated based on data from [Lenovo ServerProven](#).

Table 8. Operating system support for ThinkSystem 2.5" U.2 CD9P 3.84TB Read Intensive NVMe PCIe 5.0 x4 HS SSD, 4XB7B14456

Operating systems	SR630 V4
Red Hat Enterprise Linux 10.2	Y

IBM SKLM Key Management support

To effectively manage a large deployment of SEDs in Lenovo servers, IBM Security Key Lifecycle Manager (SKLM) offers a centralized key management solution.

The IBM Security Key Lifecycle Manager software is available from Lenovo using the ordering information listed in the following table.

Table 10. IBM Security Key Lifecycle Manager licenses

Part number	Description
7S0A007FWW	IBM Security Key Lifecycle Manager Basic Edition Install License + SW Subscription & Support 12 Months
7S0A007HWW	IBM Security Key Lifecycle Manager For Raw Decimal Terabyte Storage Resource Value Unit License + SW Subscription & Support 12 Months
7S0A007KWW	IBM Security Key Lifecycle Manager For Raw Decimal Petabyte Storage Resource Value Unit License + SW Subscription & Support 12 Months
7S0A007MWW	IBM Security Key Lifecycle Manager For Usable Decimal Terabyte Storage Resource Value Unit License + SW Subscription & Support 12 Months
7S0A007PWW	IBM Security Key Lifecycle Manager For Usable Decimal Petabyte Storage Resource Value Unit License + SW Subscription & Support 12 Months

Warranty

The CD9P SSDs carry a one-year, customer-replaceable unit (CRU) limited warranty. When the SSDs are installed in a supported server, these drives assume the server's base warranty and any warranty upgrades.

Solid State Memory cells have an intrinsic, finite number of program/erase cycles that each cell can incur. As a result, each solid state device has a maximum amount of program/erase cycles to which it can be subjected. The warranty for Lenovo solid state drives (SSDs) is limited to drives that have not reached the maximum guaranteed number of program/erase cycles, as documented in the Official Published Specifications for the SSD product. A drive that reaches this limit may fail to operate according to its Specifications.

Physical specifications

The CD9P SSDs have the following physical specifications:

Dimensions and weight of the 2.5-inch drives (approximate, without the drive tray):

- Height: 15 mm (0.6 in.)
- Width: 70 mm (2.8 in.)
- Depth: 100 mm (4.0 in.)
- Weight: 130 g (6.7 oz)

Operating environment

The CD9P SSDs are supported in the following environment:

- Temperature
 - Operating: 0°C to 75°C
 - Non-operating: -40 to 85 °C (-40 to 185 °F)
- Relative humidity (operating, non-operating): 5 to 95% (noncondensing)
- Maximum altitude:
 - Operating: -305 to +5,486 m (-1,000 to +18,000 feet)
 - Non-operating: -305 to +12,192 m (-1,000 to +40,000 feet)
- Shock:
 - Operating 9.8 km/s² (1,000 G) / 0.5ms duration
 - Non-operating (Transporting) 9.8 km/s² (1,000 G) / 0.5ms duration
- Vibration:
 - Operating: 21.27m/s² (2.17 G_{RMS}) (5 to 800Hz)
 - Non-operating: 30.38m/s² (3.10 G_{RMS}) (2 to 500Hz)

Agency approvals

The CD9P SSDs conform to the following regulations:

- Safety
 - UL (1) UL 62368-1 (USA)
 - cUL CSA C22.2 No. 62368-1 (Canada)
 - TÜV EN 62368-1 (EU)
- EMC
 - KS C 9832 (Korea)
 - FCC (3) FCC part 15 Subpart B (USA)
 - BSMI CNS 15936 (CISPR Pub. 32) (Taiwan)
 - CE EN55032, EN61000, EN55035 (EU, UK)
 - UKCA EN55032, EN61000, EN55035 (UK)
 - RCM AS/NZS CISPR 32 (Australia, New Zealand)
 - ISED ICES-003 (Canada)
 - VCCI VCCI-CISPR32 (Japan)
 - Moroccan conformity mark NM EN 55032, NM EN 55035 (Morocco)
- IEC 60950-1, IEC 62368-1
- EU: RoHS 2 Directive 2011/65/EU Category 3 EN IEC63000
